1c) estimate $k_x (g, k)$ & $u(I, \theta)$

$$\mathcal{R}_x = \frac{r_{x,i} \rightarrow \frac{nmol}{gDW \cdot hr}}{\underbrace{\mu + \theta_{mi}}_{\text{dilution & degradation}}} \qquad m_i^* \rightarrow \text{concentration } \frac{nmol}{gDW} \text{ of mRNA} \qquad \bar{u} \rightarrow \text{dimensionless}$$

$$m_i^* = \frac{r_{x,i}}{\mu + \theta_{mi}} \cdot \bar{u_i}'$$

In lecture $\quad u(I) = \dfrac{W_1 + W_2 f_I}{H W_1 + W_2 f_I}$

$$f_I = \frac{I^n}{k^n + I^n}.$$

Using Excel Solver for Data fitting, get estimates data:
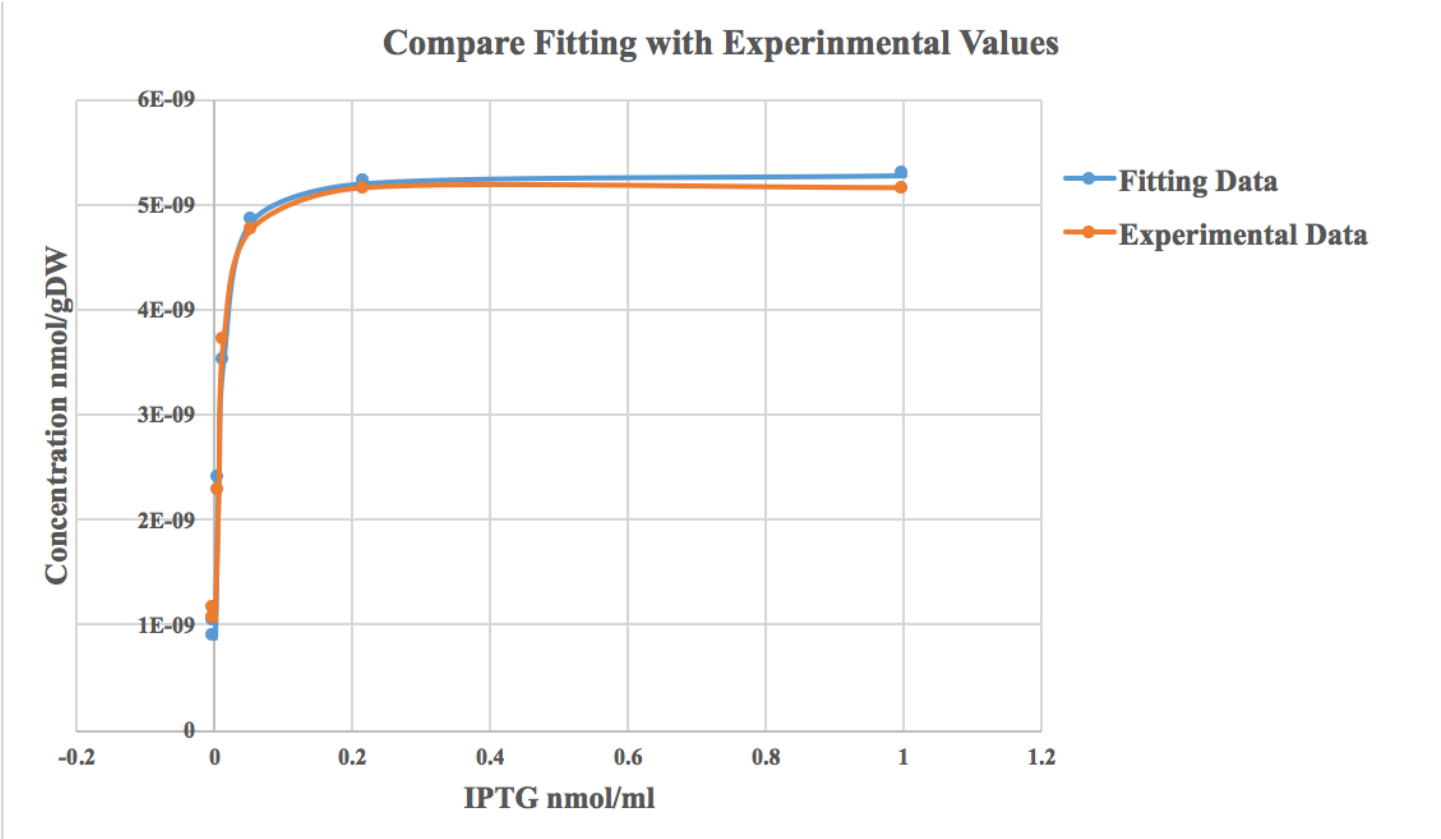

$$W_1 = 0.2$$
$$W_2 = 5000$$
$$k = 9$$
$$k_x = 5.3 \times 10^{-9}$$
$$n = 1.2$$

From Excel, it shows that th above parameter provide a fitting curve that make m^* consistent with the measured copy # as a feu-f IPTG concentration.

d). on the semilogx plot, it still shows the two set of data align. I consider the model is fair to estimate the concentration of m^* as a feu of IPTG concentration

Compare Fitting with Experimental Values

2. AC-DC

a).

Fig.1B

for bistable switch.

$$\frac{d\tilde{x}}{d\tilde{t}} = \frac{\tilde{\alpha}_x + \hat{\beta}_x S}{1 + S + (\tilde{z}/\tilde{z}_x)^{n_{zx}}} - \hat{\delta}_x \hat{x} \quad \text{①}$$

$$\frac{d\tilde{z}}{d\tilde{t}} = \frac{\hat{\alpha}_z}{1 + (\tilde{x}/\tilde{x}_z)^{n_{xz}}} - \hat{\delta}_z \hat{z} \quad \text{②}$$

where: $\hat{x}$, $\tilde{z}$ are concentration of X, Z protein

$\hat{\alpha}_x$, $\hat{\alpha}_z$ are production rate of X - Z   (basal production rate)

S is signal induced.

$\hat{\beta}_x$ production rate of S.

$\hat{\delta}_x$ & $\hat{\delta}_8$ are degradation rate of X & Z

b). Eq.[3]-[6] from paper : $\delta_z = \frac{\hat{\delta}_z}{\hat{\delta}_x}$; $t = \tilde{t}\,\hat{\delta}_x$; 〔it should be $\tilde{\delta}_x$ instead of δ_x〕

$\alpha_x = \frac{\hat{\alpha}_x}{\hat{\alpha}_z}$, $\beta_x = \frac{\hat{\beta}_x}{\hat{\alpha}_z}$; $z_x = \frac{\tilde{z}_x \tilde{\delta}_x}{\hat{\alpha}_z}$, $x_y = \frac{\tilde{x}_y \tilde{\delta}_x}{\hat{\alpha}_z}$, $x_z = \frac{\tilde{x}_z \tilde{\delta}_x}{\hat{\alpha}_z}$

$X = \frac{\tilde{X}\tilde{\delta}_x}{\hat{\alpha}_z}$, $Z = \frac{\tilde{z}\tilde{\delta}_x}{\hat{\alpha}_z}$

Plug in ① ② in (2a)

$\longrightarrow$

①

$$\frac{d\tilde{x}}{d\tilde{t}} = \frac{d(x\hat{a}_z)}{\hat{\delta}_x\, dt}\frac{\hat{x}}{\hat{\delta}_x} = \frac{\alpha_x\cdot\hat{a}_z + \beta_x\hat{a}_z S}{1+S+\left(\frac{\hat{a}_z\cdot Z}{\hat{\delta}_x}\cdot\frac{\hat{\delta}_x}{z_x\hat{a}_z}\right)^{n_{zx}}} - \frac{\hat{\delta}_x x\cdot\hat{a}_z}{\hat{\delta}_x}$$

$$= \frac{\hat{a}_z\,dx}{dt} = \frac{\hat{a}_z(\alpha_x+\beta_x S)}{1+S+\left(\frac{z}{z_x}\right)^{n_{zx}}} - \hat{a}_z x$$

$$\Rightarrow \boxed{\frac{dx}{dt} = \frac{\alpha_x + \beta_x S}{1+S+(Z/z_x)^{n_{zx}}} - X\ ;}$$

similarly ② becomes :

$$\boxed{\frac{dz}{dt} = \frac{1}{1+(X/x_z)^{n_{xz}}} - \delta_z Z}$$

c). Given $\quad \alpha_x = 1.5,\ \beta_x = 5.0,\ Z_x = 0.4\ n_{zx} = 2.7\quad x_z = 1.5\quad n_{xz} = 2.7\ ,\ \delta_z$ pick 1.24.

See matlab plots.

the stable steady state part seems match the diagram in Fig 13.

d) See matlab codes for plots.

e). stable s.s , below Hopf
① I would select $\quad S = 0.7\qquad$ S.S. of x, y, z are: $X_s = 0.0036$

(See matlab for plots.) $\qquad\qquad\qquad\qquad\qquad\qquad\qquad Y_s = 2.015$

$\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad z_s = 0.0029$

cell 1 at s.s

cell 2 25% higher than s.s.

cell 3 25% lower than s.s.

the oscillation is incoherent for the change of S from $0.7 \to 100$

② S above the saddle node $\quad S = 1010\qquad$ S.S. of X, y, z are :

Xs=2.9908
Ys=0.96595
Zs=0.01412

The oscillation is coherent for this case, (S from $1010 \to 100$)
b/c the peaks can align each other for the 3 cells.

-c).

at s.s. $\frac{dx}{dt} = 0$, $\frac{dz}{dt} = 0$.

$$\frac{\alpha x + \beta_x S}{1 + S + (\frac{z}{z_x})^{n_{zx}}} - x = 0$$

plug in $\alpha_x = 1.5$, $\beta_x = 5.0$, $z_x = 0.4$

$$\frac{1}{1 + (\frac{x}{x_z})^{n_{xz}}} - \delta_z z = 0.$$

$n_{zx} = 2.7$, $x_z = 1.5$, $n_{xz} = 2.7$

$\delta_z = 1.04$

$$\left\{ \begin{array}{l} \dfrac{1.5 x + 5 S}{1 + S + (\frac{z}{0.4})^{2.7}} - x = 0 \quad \text{①} \\[4ex] \dfrac{1}{1 + (\frac{x}{1.5})^{2.7}} - 1.04 z = 0 \quad \text{②} \qquad z = \dfrac{1}{1.04\left(1 + (\frac{x}{1.5})^{2.7}\right)} \end{array} \right.$$

⇊.   plug ② in ①.

$$\frac{1.5 x + 5 S}{1 + S + \left(\frac{1}{0.4 \cdot 1.04\left(1 + (\frac{x}{1.5})^{2.7}\right)}\right)^{2.7}} - x = 0.$$

find x, S show on Excel

% Explanation from the paper: "This difference in behavior is a
 consequence of the different
% initial gene expression states in relation to oscillatory spiral
 center. In a Hopf bifurcation,
% oscillations arise through an attracting spiral losing its stability
 and becoming a repulsing spiral.
% Hence, oscillations originating from a Hopf bifurcation start their
 transient close to the unstable
% spiral center, and a small variation in the initial condition can
 lead to a substantial difference in the
% final oscillation phase. Small initial differences are amplified,
 resulting in lack of coherence of
% oscillations for a population of cells undergoing the bifurcation.
 By contrast, cells passing
% through the saddle-node bifurcation toward the limit cycle do so at
 expression levels that are far from
% those associated with the attracting oscillatory regime.
 Consequently, they have the
% same initial phase, and stochastic trajectories are canalized
 together toward the oscillatory state."
